UTILITY ROCK DRILLING SYSTEM

WRS is proud to introduce our state-of-the-art Utility Rock Drilling System to support installation of utility poles in rock formations or other hard surfaces.

WRS engaged Center Rock to build a trailer mounted system to maximize the effectiveness and efficiency of their advanced utility LP Drill. The LP Drill four hammer design provides many benefits over the common mono hammer drills. The low headroom, limited air requirements, minimum vibration and lightweight construction allows the drill to be mounted on a Digger Derrick or many off road vehicles. The advanced four hammer sequential design for drilling limits overspray of rock cuttings, damage from vibration and public complaints regarding noise and dust.

The addition of Rock Drilling to WRS' already established Industrial Vacuum, Hydro Excavation and Coring services offers versatility for our Utility & Contractor clients.
